ZMS Ads Intelligence Dashboard

Google Ads API Design Document — Basic Access Application

Company	Zeal Media Solutions (zealmediasolutions.com)
Tool name	ZMS Ads Intelligence Dashboard
Tool type	Internal reporting dashboard (read-only)
API contact	carl@zealmediasolutions.com
Manager account (MCC)	590-821-8498
Google Cloud project number	594922650687
Users	Internal employees only
API capabilities used	Reporting only — no account, campaign, or asset mutations

1. Business Model and Purpose

Zeal Media Solutions is a digital marketing agency serving approximately 19 home-services businesses (plumbing, roofing, landscaping, HVAC, electrical, and general contracting). We manage paid advertising campaigns for these clients on Google Ads and Meta Ads under our own Google Ads manager account (MCC 590-821-8498). Each client's Google Ads account is a child account of our MCC.

The ZMS Ads Intelligence Dashboard is an internal, self-hosted reporting tool that consolidates daily campaign performance from Google Ads, Meta Ads, and our CRM into a single view for our account managers. Its purpose is purely analytical: our team uses it to monitor spend, leads, cost per lead, and appointment conversion across all managed client accounts, so that budget and optimization decisions can be made quickly. The tool is not sold, licensed, or exposed to anyone outside our company. Clients do not access it. There is no third-party or public access of any kind.

2. Intended Audience and Access Control

- Internal employees of Zeal Media Solutions only (fewer than 10 users).
- Login is invite-only via our identity provider (Supabase Auth); public sign-up is disabled.
- The tool is hosted on company-owned hardware and exposed only through an authenticated web app on our own domain.
- API credentials (developer token, OAuth refresh token) are stored server-side in environment configuration and are never exposed to the browser or to end users.

3. Google Ads API Usage

3.1 Authentication

OAuth 2.0 authorization is completed once by our MCC administrator; the resulting refresh token is used by the reporting service. All API calls set `login-customer-id` to our MCC (5908218498) and query each managed client account by its customer ID. We access only accounts linked under our own MCC.

3.2 Services and queries

The tool uses a single service: `GoogleAdsService.SearchStream`. Two GAQL queries are issued per client account per sync:

```
-- Campaign performance, one row per campaign per day
SELECT campaign.id, campaign.name, campaign.status,
       metrics.cost_micros, metrics.impressions, metrics.clicks,
       metrics.conversions, metrics.phone_calls,
       segments.date
FROM campaign
WHERE segments.date BETWEEN '{start}' AND '{end}'

-- Account metadata (timezone and currency)
SELECT customer.time_zone, customer.currency_code FROM customer
```

3.3 Call volume and scheduling

One scheduled sync per day at 6:15 AM Pacific Time. Each sync issues 2 SearchStream requests per client account × ~19 accounts ≈ 40 requests per day. A one-time historical backfill (up to 12 months per account) is performed when a client is first added. The daily sync re-reads a rolling 30-day window to capture conversion lag restatements. Requests are made sequentially with standard retry/backoff on transient errors; expected volume is far below Basic Access limits (15,000 operations/day).

3.4 Capabilities NOT used

The tool performs no mutations of any kind: no account creation, no campaign creation or management, no bidding or budget changes, no keyword planning, no audience or conversion uploads, and no use of the App Conversion Tracking and Remarketing API. Because the tool is reporting-only and internal, Required Minimum Functionality (RMF) for full-service tools does not apply.

4. Architecture and Data Flow

```
Google Ads API (SearchStream, read-only)
        |
        v
Python sync service (scheduled daily, per client account)
        |
        v
PostgreSQL database (raw rows + daily campaign metrics table)
        |
        v
Internal REST API (JWT-authenticated)
        |
        v
Web dashboard (employees only, invite-only login)
```

Retrieved metrics are stored in our private PostgreSQL database and joined with Meta Ads and CRM data to compute blended cost-per-lead and appointment metrics. Data is retained for internal reporting

only, is not resold, is not shared with third parties, and is not used to build any advertising product.

5. User Interface

The dashboard has three screens. (1) Agency Overview: a table with one row per client showing Google Ads spend, leads (conversions), CPL, alongside Meta metrics and blended totals for a selected date range. (2) Client Detail: daily spend/leads trend chart and a campaign-level table (campaign name, status, spend, impressions, clicks, CTR, conversions, CPL) for one client. (3) Settings: administrator screen mapping client accounts and showing sync status. Example of the campaign-level table:

Campaign	Status	Spend	Impr.	Clicks	CTR	Leads	CPL
Search - Emergency Plumbing	ENABLED	$1,240.50	48,200	2,150	4.46%	31	$40.02
Performance Max - Service Area	ENABLED	$860.00	112,400	1,890	1.68%	18	$47.78
Search - Brand	PAUSED	$120.10	6,300	410	6.51%	6	$20.02

6. Policy Compliance

- Read-only reporting on accounts managed under our own MCC; no third-party account access.
- No resale, licensing, or redistribution of Google Ads data; data is shown only to our employees.
- Credentials secured server-side; access to the dashboard requires authenticated, invite-only login.
- The tool respects rate limits with sequential requests and exponential backoff, and we will keep the API contact email (carl@zealmediasolutions.com) monitored for policy communications.
